AUTHOR:

Yakovlev, S. M. (Moscow)

103-19-3-4/9

TITLE:

The Theory of the Structure of Combinatorial Mechanisms
(Teoriya struktur kombinatornykh mekhanizmov)

PERIODICAL:

Avtomatika i Telemekhanika, 1958, Vol. 19, Nr 3, pp. 221-227 (USSR)

ABSTRACT:

In telegraphy, remote control, in railroads, textile industry etc. mechanisms are used which transform the space-combinations for the displacement of their input-elements (levers, bars), into certain space-combinations for the displacement of the output-elements. These mechanisms are here comprised under the conception of combination-mechanisms. 1948-1949 a systematic investigation of the structure of combination-mechanisms was performed and a method for their analysis and synthesis on the basis of the Boolean (bulevaya) algebra (algebra of logics, applications techniques de la logique (Ref 2) was worked out by the author. The results of these research works are here given somewhat more precisely. The results were already communicated in 1949 in the Seminar for Mathematical Logic in the State University, Moscow. At first the structure of the combination-mechanisms

The Theory of the Structure of Combinatorial Mechanisms

with 2 positions is investigated. On its 2 fundamental types that one is investigated here where the displacement of the input-elements only prepares the displacement of the output-elements, by releasing or blocking the latter, whereas the displacement itself must be done by other elements of the elements of the mechanism. For an exact mathematical investigation the author now applies the algebra of logic and the algebraic writing-down of the blocking conditions. Then he shows which blocking conditions and thus, which Boolean functions can be realized by simplest combinations of elements. On this basis the analysis of the structure can be algebraically performed. Therefore the work of very complicated combination-mechanisms can also be analyzed in this manner. The algebraic synthesis of the structure of combination-mechanisms can be performed in the following manner. The fact is used that the conjunctions "and", "or", "not" agree with the operations of the Boolean multiplication, Boolean-addition and inversion (negation) and the blocking conditions for the output-elements (which usually are given orally) can be written down in an algebraic form. The Boolean functions thus obtained are by means of identical algebraic

transformations brought to a form convenient for realization. Then the scheme of the mechanism is drawn by starting from the above-mentioned agreements between the structure of the Boolean functions and the structure of the combination-elements of the mechanisms. - The synthesis of the decoder of a telegraph apparatus is given as an example. - G. N. Povarov advised the author. There are 11 figures and 7 references, 5 of which are Soviet,

AUTHOR: Yakovlev, V. (of Leningrad)

TITLE: 420-425 mc Receiver (Priyemnik na 420 - 425 mc)

PERIODICAL: Radio, 1956, Nr5, pp. 30-31 (USSR)

ABSTRACT: A description of a self-made receiver for 420-425 mc designed for the reception of amateur AM radio stations. A single-grid circuit frequency converter uses type 6 \times K37 tube. Type 6C17 is used for heterodyne. Three i.f. amplification stages use 6 \times K37. Two l.f. amplification stages use 6527 and the output stage 6H157.

I.f. is selected 10.5 mc, and the i.f. channel should be 0.9 to 1.3 mc wide at the 6 db level. Sensitivity of the receiver 10 to 20 μ v at the output voltage on the head phones 1 to $1\frac{1}{2}$ v.

There are 1 schematic diagram and 1 chassis view in the article.

"Electromechanical Intermediate Frequency Filters," pp 30-34, ill.

Abst: An examination is given of intermediate frequency electromechanical filters with magnetostrictive excitation. The article describes filters prepared in the form of an oscillator system, consisting of a series of flat, rectangular plates, or in the form of circular metallic discs. The advantages of these filters (stability in operation, insensitivity to vibrations, small dimensions and weight) are noted.

YAKOVLEV, V.
"Three-Band VHF Receiver," by V. Yakovlev, Radio, No 5, May 57,
pp 33-35

This VHF superheterodyne radio receiver is designed for amateur reception on frequency bands of 38-40 Mc, 144-146 Mc and 420-425 Mc. The set has an aperiodic radio-frequency amplifier which substantially increases its sensitivity. The set will operate from a 100 or 221 v ac power line and consumes about 45 w.

The set has five tubes: tube 6SLP, aperiodic RF amplifier; 6S1Zh, superregenerative stage; 6Zh3P, first stage of the audio amplifier; 5N15P, power amplifier; and 6Ts4P, rectifier.

Tuning of all the wave bands is carried out with the aid of a signal generator SG-1. After proper tuning the set will have the following sensitivity for the three wave bands: 2 to 5 microvolts for 38-40 Mc and 144-146 Mc wave bands and 10 microvolts for the 420-425 Mc wave band. (U)
